I don't know what I want, when it comes to relationships; I'm always happy and proud to be in a good relationship. But that doesn't always mean that it's a good relationship, and I wouldn't want to give up on it. I want to be the best I can be. So, as long as I'm happy, that is fine. I'm always going to make sure that I am the best I can be for myself and for the people who I love. For me, it's more about the journey, not the destination, but I never want to settle for anything less than the best for me. So I want to be a better person,

---

and I want to have a better relationship in the long run. But I guess I'll always have my flaws, and I'm not perfect, so I'm not settling for less. I still want the best for myself. In recent years, an increasing number of products available to consumers can include useful electronic components such as processors, memory, and microcontrollers. Often, such products are portable and have thus become smaller and smaller and are able to be more and more powerful. For a variety of reasons, however, manufacturers of such products also desire that the products be rugged, reliable, have a long life, and, by their nature, be small, simple and inexpensive to manufacture. Such a combination of attributes has, for example, led manufacturers of color video players to integrate the video processor and other components, such as the read-only memory (ROM), onto a single integrated circuit (IC) die that is then mounted in an IC package. Also, such packaging has allowed the manufacture of the overall IC die to be accomplished using techniques applicable to other non-video IC packages such as dicing of IC chips after they are fabricated on a wafer and prior to their assembly. There are, however, some problems associated with the manufacture of ICs containing video processing circuitry. For example, it is possible for a memory device fabricated on such a video IC to be corrupt or damaged by the ionizing radiation used in such manufacture. Also, products such as hand-held video cameras are subject to damage from knocks and other types of force. Also, the video IC can produce or have electrical noise caused by the switching of large capacitive loads, such as the large capacitive load associated with a bias voltage source and its connection to the base of a transistor of the video processing circuitry. All of these problems can be caused by
